TITLE: The development and application of "dynamo-reactive" grenade launchers in the mining industry

SOURCE: Gornyy zhurnal, no. 2, 1966, 57-60

TOPIC TAGS: mining engineering, grenade, ground weapon, weapon launcher

ABSTRACT: In 1960, the Ramenskoye Branch of VNIIGeofiziki (Ramenskoye otdeleniye VNIIGeofiziki) began research on the design of a firing system to eliminate overhangs in mining operations. One of the most acceptable versions of the design is a system operating on the recoilless weapon principle: the "dynamo-reactive" cannon

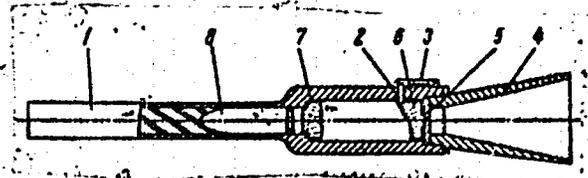

Fig. 1. Diagram of a recoilless cannon.

(see Fig. 1). The advantages of the proposed device are: small caliber, low weight, no recoil with high power, high maneuverability, and the opportunity of firing dummies or high-explosive projectiles. Further research resulted in the design of the DRS-130 dynamo-reactive grenade launcher (see Fig. 2). The results obtained in

2

ballistic tests were excellent and tests were conducted under field conditions. In addition to its main function, the grenade launcher may also be used to string cable, to eliminate the danger of avalanches, and to break up ice formations in rivers. Orig. art. has: 4 figures and 1 table. [08]

(Nasos dlya perelivaniya kislot i yadovitykh reaktivov)

PERIODICAL: Zavodskaya Laboratoriya, 1957, Vol. 23, Nr 9, pp.1134-1134 (USSR)

ABSTRACT: This pump consists of a glass body to which a projecting part is soldered and which is provided with a well ground-in inlet valve with a limiter. A tube is welded into the glass body, which is provided at its lower end with a well ground-in outlet valve with limiters, and at its upper end with a snout for pouring. The pump works by means of an ordinary rubber vessel which is connected to the projecting part by means of a rubber tube. The glass body is fastened in a rubber ring in the neck of the bottle. There is 1 figure.

PERIODICAL: Zavodskaya Laboratoriya, 1957, Vol. 25, Nr 9, pp.1135-1135 (USSR)

ABSTRACT: The absorber described here consists of two vessels and glass tubes. The measurements of the vessels are determined by the volume of the gas sample for an analysis. After the absorber is mounted on the stand, it is connected by means of a capillary tube with the crest of the apparatus, and the absorption liquid is poured into the neck between the vessels through a gap of 2-3 mm width. Insulation against air can be attained by applying a layer of vaseline oil to the absorption liquid. There is 1 figure.

TITLE: Special Device for Calibrating Rheometers and Determining Gas Flow Velocities

PERIODICAL: Zavodskaya laboratoriya, 1961, Vol. 27, No. 1, pp. 120-121

TEXT: The author developed a device for testing rheometers and determining the flow velocity of gases. The device consists of two automatic stabilizers for adjusting the water level, a pressure gage, and a timepiece with secondhand. Fig. 1 shows an arrangement of apparatus for testing rheometers and determining the gas flow velocity in a capillary tube. Before making the measurement, the constancy of the pressure gage must be checked. The gas flow velocity is measured by a special device. The pressure difference of the gas in front of and behind the capillary tube is determined by a scale, and the gas consumption is established from the velocity of the gas flow through the capillary tube. There are 2 figures. ✓

TITLE: Absorption, excitation and infrared-stimulated flash in calcium and strontium sulfide phosphors /Report, Fourteenth All-Union Conference on Luminescence (Crystal Phosphors) held at Riga, 16-23 Sept. 1965/

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v.30, no.9, 1966, 1552-1554

TOPIC TAGS: calcium compound, strontium compound, sulfide, absorption band, absorption edge, photoluminescence, irradiation, electron trapping

ABSTRACT: The authors investigated the infrared absorption of CaS films and the infrared absorption and luminescence excitation spectra and the infrared stimulated flash of different CaS and mixed CaS.SrS phosphors. The absorption spectra were recorded for photon energies from about 3 to 6 eV with 200 to 2000 Å thick films deposited by different techniques on LiF or fused quartz substrates. The CaS absorption in the long wavelength portion of the investigated range depended considerably on the presence and nature of impurities, but in the short wavelength part of the range it did not. The absorption edge, defined as the position of the greatest slope of the absorption curve, was 5.1 ± 0.3 eV. The absorption spectrum exhibited structure, and this structure was repeated in the luminescence excitation spectra.

Card 1/2

ACC NR: AP7005001

Addition of SrS to the CaS shifted the absorption edge toward lower photon energies, and the absorption peaks shifted toward shorter wavelengths with decreasing temperature at rates ranging for different specimens from 0.7 to 1.4 Å/degree. The infrared-stimulated flash in CaS.SrS:Ce:Sm phosphors was investigated at different temperatures. At -196° C the phosphor was sensitive to infrared radiations with wavelengths as long as 2.85 μ, whereas at -120° the infrared sensitivity did not extend even to 2 μ. The brightness of the infrared-stimulated flash was temperature dependent, having a minimum at -150° C and a maximum at -10° C for stimulation at a wavelength of 1.25 μ. The decrease in the flash brightness with increase of the temperature from -196 to -150° is ascribed to decrease of the light sum stored in shallow traps, and the increase in the flash intensity with increase of the temperature from -150 to -10° is ascribed to decrease in the probability for trapping of electrons in traps having a depth of 0.25 eV. TITLE: Stabiliser of Magnetic Field (Stabilizator magnitnogo polya)
PERIODICAL: Izvestiya Akademii NaukSSSR, Seriya Geofizicheskaya, 1958, pp 917 - 920 (USSR)

ABSTRACT: The geomagnetic laboratory of Leningrad University designed an apparatus which diminishes the effect of the exterior electromagnetic field on the field of a measuring instrument based on the magnetic principle. The apparatus generates its own electric current in proportion to the variations of a magnetic field required to be stabilised. The Helmholtz circuit is added in order to maintain an exact relationship between the magnetic field and the electric current. The magnetometer, type M-2, is employed as a part of the design (Figure 1). It was modified by the inclusion of a photo-electric device. The light of the small car bulb (1) is projected onto the plate (5) by means of the prism (2), the objective (3) and a mirror of the magnetometer (4). The plate (5) screens the photocell (6). When, due to movement of the mirror, some light falls on the photocell, an electric current will generate. This

Card1/3

Stabiliser of Magnetic Field

SOV/49-58-7-10/16

current, after being amplified by (7), is directed to the coil (8) placed near the magnetometer. The purpose of the coil is to produce an electromagnetic field in order to counteract the variations of the magnetometer field.

If H denotes the field inside the instrument and the angle of magnet reflections is $k_1 H_1$ the amplified current will be i . The field produced by the coil (8) is H_2 . The field of the instrument will be affected by the variations of the Earth's magnetism, as indicated by Eqs.(1) to (3).

Several types of the amplifier can be used. The simple type (Figures 2 and 4) will give a satisfactory result but if a higher coefficient of intensification is required, a more powerful type (Figure 3) should be employed.

The coefficient of intensification k , in relation to the magnet deflection of the instrument, can be calculated from the Eqs.(4) to (6).

In practice, the results obtained were very consistent.

Card2/3

Stabiliser of Magnetic Field

SOV/49-58-7-10/16

The instrument, placed in a building situated in the midst of a heavy traffic of tramways and trolley-buses, gave a magnetic stabilisation of 2-3 γ for the variations in the magnetic field ranging from 60 to 100 γ . These variations, in spite of their rapid character, never affected the steadiness of stabilisation.

There are 4 figures and 2 references, 1 of which is Soviet and 1 French.

TITLE: Investigations on Combining the Synthesis of Methanol with Destructive Hydrogenation Processes. (Opyt sovme-shoheniya sinteza metanola s protsessami destruktivnoy gidrogenizatsii).

PERIODICAL: Khimiya i Tekhnologiya Topliv i Masel, 1958, Nr. 1. pp. 9-17). (USSR)

ABSTRACT: Data on 2 years experimental plant work are given in which the synthesis of methanol was combined with destructive hydrogenation. These experiments were based on the idea of replacing the purification of hydrogen from CO with an ammoniacal solution of a copper salt by the synthesis of methanol. The gas (after washing with water) contains 5% CO; this content is decreased to 1 - 2%. After the condensation of methanol, the gas is used for hydrogenation. Initially, the methanol synthesis plant was connected to the vapour phase hydrogenation plant, by-passing copper-ammoniacal purification (Fig. 1). In the hydrogenation plant the petroleum raw materials are treated in the form of a kerosene-gas oil fraction, vacuum distillate and a mixture of medium fractions of tar from semi-coking and crude petroleum oil.

Card 1/3

65-1-3/14

Investigations on Combining the Synthesis of Methanol with Destructive Hydrogenation Processes.

Fresh synthesis gas is diluted with the recirculated gas to decrease the CO concentration and to prevent carbonyl corrosion of the heat exchangers. The synthesis plant is described. Mean monthly compositions of the synthesis and circulating gas (Table 1), data on crude methanol (Table 2) and data on the temperature distribution in the catalyst (Table 3) are given. An analysis of the plant operation shows that, with low CO concentrations, the process can be controlled easily. A modified plant is shown in Fig.2 when an additional synthesis column was joined in parallel. Plant operating data are given in Tables 4 - 9. The water gas still contained a high percentage of nitrogen, inspite of a considerable blow-off of the residual gases. In view of this a scheme was developed in which gas from the methanol synthesis passes into an ammoniacal-copper purification plant where it is freed from oxygen containing admixtures and passed into an ammonia synthesis plant, where nitrogen is converted into ammonia. The gas is then led to the hydrogenation plant (Fig.3). This scheme was carried out in 2 stages: (1) only the ammoniacal copper puri-

TITLE: Concerning a Method of Substance Transfer Between Electrodes in Vacuum (Letter to the Editor)

PERIODICAL: Radiotekhnika i elektronika, 1960, Vol 5, Nr 2, pp 351-352 (USSR)

ABSTRACT: When a voltage somewhat under breakdown level is applied to a vacuum gap between electrodes, crumbling of electrode material at micro-protrusions can be expected, where the field and, consequently, ponder-motoric forces are amplified as compared with their average values. Ponder-motoric forces do not reach levels higher than the tensile strength of most electrode materials. However, the required force at the instant immediately prior to breakdown may be considerably lower at certain spots due to micro-cracks caused by the pulling force of the electric field. The authors observed and photographed the motion of particles of matter leaving the surface

Card 1/3

Concerning a Method of Substance Transfer
Between Electrodes in Vacuum (Letter to the
Editor)

SOV/109.5-2-26/26

of one degassed electrode and traveling to the other
electrode. Rupture stress of graphite is (0.5 to 0.75)
 $\cdot 10^8$ dyn/cm². Bender-motoric forces could reach
 10^8 dyn/cm² under test conditions (U = 36 kv, d = 1.3 mm,
 $r_k = 0.04$ cm). The separation of a particle was
recorded at the 85-th voltage application which excludes
the possibility of a loose particle being left after the
machining of electrodes. The authors think that the
transfer of matter was the result of material being
loosened by consecutive stress load applications. It
should be of importance to find whether a similar
transfer eventually may be possible also between metal
electrodes. It was observed during earlier experiments
that a certain relation exists between the breakdown
voltage and the mechanical strength properties of the
anode material. It is possible that the detachment and
transfer of substance particles creates a conductive
medium for current in vacuum. There is 1 figure; and

Fractions of Microparticles in 14 Day Old Rats."

Prague, Ceskoslovenska Fysiologie, Vol 15, No 2, Feb 66, pp 89-90

Abstract: The jejunum homogenate has maximum activity at pH 3.5,
the microparticle fraction at pH 5.5. It appears that two
beta-galactosidases are present in the jejunum. The two show
different affinity for various substrates. 1 Figure, 4 Western,

TITLE: A 24-channel semiconductor [telephone installation]

SOURCE: Tekhnika i vooruzheniye, no. 3, 1965, 38-39

TOPIC TAGS: multichannel telephone system, telephone equipment, *coaxial cable, radio transmission, UHF*

ABSTRACT: A 24-channel telephone terminal for use in coaxial cable or ultra-short wave military radio transmission is described. It may handle 23 one-way and/or 11 two-way conversations. In each case one channel is reserved for synchronization, since the channels with pulse amplitude modulated signals are time multiplexed. The speech bandwidth of each channel is between 300 and 3400 cps. The 8-kc system clock allots 5.2 μ sec for each channel during each clock period. Only 3.7 μ sec are used, however, to prevent channel interference. Other characteristics of the system are: S/N ratio is 65 db, channel separation is 65 db, input and output levels are 0 and 0.8 nepers, respectively, dc power consumption is 50 W, and dimensions are 602 x 390 x 1654 mm. The terminal is divided into two parts, which are functionally interchangeable. Orig. art. has: 1 figure.

"Undesirable Factors Affecting the Stability of Insulin Preparations."

Prague, Ceskoslovenska Farmacie, Vol 15, No 9, Nov 66, pp 504-505

Abstract [Authors' English summary modified]: The effect of direct light, frost, high temperature, and the quality of rubber caps on the stability of insulin preparations was investigated. Frost damages insulin; so does a temperature of 70°C even during a brief exposure. Direct light lowers the stability. Only stoppers which do not contain substances reactive to the drug can be recommended. 2 Figures, 4 Czech references.

TITLE:

On an Approximation Method for the Investigation of Plane Turbulent Flows in Magnetic Hydrodynamics (O priblizhennom metode issledovaniya ploskikh vikhrevykh techeniy v magnitnoy gidrodinamike)

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 126, Nr 6, pp 1220-1223 (USSR)

ABSTRACT:

The present paper considers the plane steady turbulent motion of an ideal compressible liquid which is exposed to a magnetic field perpendicular to the flow plane. An investigation is made of the interaction of magnetic and hydrodynamic phenomena of a conductive medium with infinite conductivity, and the determination of the main parameters of the medium is made mathematically in the form of solution of a nonlinear system of partial differential equations (1). From the equations of continuity and the field equation, equation (2) is obtained, and by substituting the latter into (1), the equation system (3) is expanded. This system is equivalent to the system of the common hydrodynamic equations in the equation of state (4). In the latter, both the pressure of the magnetic field and the gas

Card 1/2

On an Approximation Method for the Investigation
of Plane Turbulent Flows in Magnetic Hydrodynamics

SOV/20-126-6-18/67

pressure are taken into account. Investigation of the medium properties is carried out by integration of the equations (6). New variables are introduced, and the differential equation (26) is then expanded, from which the stream function (27) is obtained with Fourier's method. There are 1 figure and 2 Soviet references.

TITLE: Some problems of magnetohydrodynamics with regard to the finite conductivity of the medium

PERIODICAL: Vestnik Moskovskogo universiteta. Seriya 3, fizika, astronomiya, no. 1, 1961, 49-55

TEXT: The author suggests an approximation method for studying the parameters of a plane steady motion of a conducting gas taking account of "magnetic" viscosity in the presence of a magnetic field perpendicular to the direction of flow. With

$$\text{rot}[\bar{v}^* \bar{H}^*] = -\eta \nabla^2 \bar{H}^*; \text{div} \bar{H}^* = 0;$$

$$(\bar{v}^* \nabla) \bar{v}^* = -\frac{1}{\rho^*} \nabla \rho^* + \frac{f^*}{\rho^*}; \text{div}(\rho^* \bar{v}^*) = 0; \rho^* = f(\rho^*, s^*), \quad (1)$$

the author gives a system of equations for a plane steady motion of an ideal compressible liquid of finite conductivity in a transverse magnetic field $H = H(0, 0, H)$. Here, $\eta^* = c^2/4\pi\sigma^*$ is the coefficient of magnetic

Card 1/4

Some problems of magnetohydrodynamics...

S/188/61/000²¹²¹¹/001/006/009
B104/B203

viscosity, $f^* = -\nabla H^{*2}/8\pi$ is the volume density of electromagnetic forces. By introduction of the dimensionless parameters

$$H = \frac{\bar{H}^*}{a_0 \sqrt{\rho_0}}; \bar{v} = \frac{\bar{v}^*}{a_0}; \rho = \frac{\rho^*}{\rho_0}; p = \frac{p^*}{\rho_0 a_0^2}; x = \frac{a_0}{r_0} x^*; \\ y = \frac{a_0}{r_0} y^*; \eta = \frac{\eta^*}{r_0}, \quad (2)$$

(1) may be represented in the form:

$$\text{rot}[\bar{v}\bar{H}] = -\eta \nabla^2 \bar{H}; \text{div} \bar{H} = 0; \\ (\bar{v}\nabla)\bar{v} = -\frac{1}{\rho} \nabla P; \text{div}(\rho\bar{v}) = 0; P = f_1(\rho, s). \quad (3)$$

where $P = p + H^2/8\pi$ is the total pressure of gas and magnetic field. It is shown that this system for $\eta = \text{const}$ and $\text{div} H = 0$ can be studied by methods applicable to pure hydrodynamic potential flows. If, however, η must be regarded as a function of an independent variable, e. g., $\eta = \eta(T)$, a method developed by the author in a previous paper (Ref. 1: Nochevkina L.I., DAN; SSSR, 126, 6, 1959) must be used for the study. As an example, the author studies the outflow of an ideal compressible liquid from an infinitely large vessel with the existence of a conductivity gradient in Card 2/4

ZLZLF
S/188/61/000/001/006/009
B104/B203

Some problems of magnetohydrodynamics...

the direction of flow. It is shown that the methods developed in hydrodynamics are also applicable to cases where magnetic viscosity is constant or has a gradient in the direction of flow. This approximation method can also be used to study an ultrarelativistic motion of conducting media in the presence of any magnetic field. Here, the motion of a relativistic gas must be described in the form of a zero equation for the divergence of the mechanical and electromagnetic energy momentum tensors. It is shown that with any magnetic field it is sufficient to study the modified energy momentum tensor of macroscopic bodies, comprising the additional enthalpy w' and the additional pressure p' . w' and p' are indicated in

$$w' = \frac{v}{4\pi} \left(F_{ij} F_{ij} + \frac{u^2}{c^2} \frac{F_{im}^2}{4\pi} \delta_{ik} \right) U \mu_k; p' = - \frac{F_{im}^2}{16\pi^2} \left(\theta = \sqrt{1 - \frac{u^2}{c^2}} \right), (21)$$

Here, F_{ik} are the components of the tensor of the electromagnetic field in the reference system K' to which, at a given instant, the gas elements are moving at a relative velocity u . Finally, the author studies the parameters of a plane steady flow of an ultrarelativistic gas in a given magnetic field with conservation of isentropic conditions by the method developed by him in the preceding paper. The study is carried out for an

Card 3/4

Some problems of magnetohydrodynamics...

21211
S/188/61/000/001/006/009
B104/B203

infinitely small gas element in the laboratory system K', and shows that a magnetic field perpendicular to the flow does not disturb the isentropy of the flow of an ultrarelativistic gas. An arbitrarily oriented magnetic field, however, disturbs the isentropy in general. Chaplygin is mentioned. There are 1 figure and 4 Soviet-bloc references.

Title : Specific Resistivity of Thin Layers of Tin

Orig Pub : Rev. phys. Acad. RPR, 1958, 3, No 2, 107-118

Abstract : A study was made of the resistance of layers of tin of thickness of 0.1 to 200 millimicrons as functions of the temperature and of the thickness of the layer. All the measurements were carried out in a vacuum of approximately 5×10^{-8} mm mercury. The method of the measurements was previously described (Ciorascu F. and others, Revue de Physique, Acad. RPR, 1957, 2, No 1, 59; No 2, 199). The layers, sputtered on a substrate at a temperature of 77° K, acquire a measureble electric conductivity at the thickness of approximately 0.1 millimicrons, while layers sputtered on a substrate at 293° K acquire it at a

Card 1/3

RUMANIA/Electricity - Matter with Metallic Conductivity. G

Abs Jour : Ref Zhur Fizika, No 10, 1959, 22974

thickness of 5 millimicrons. As the thickness of the layer increases, the specific resistivity first diminishes rapidly, and then more slowly, reaching a value of the specific resistivity of the bulk specimen for layers of the former type at 6.5 millimicrons, and for layers of the second type at 150 millimicrons. From among the layers having the same resistivity, the one which is sputtered on a substrate with higher temperature has the greater thickness. The authors explain this phenomenon by the fact that the reduction in the substrate entails a reduction in the migration of the atoms and a formation of a solid layer. As the temperature of the substrate is increased, the migration of the atoms increases and contributes to the formation of granules that are isolated from each other. A study of the change and resistance of thin layers as a function of the temperature has shown that with increasing temperature the resistance

 SOURCE: Przegląd epidemiologiczny, v. 19, no. 3, 1965, 309-313
 TOPIC TAGS: bacteriology, penicillin, streptomycin, tetracycline, erythromycin,
 neomycin
 ABSTRACT: Sensitivity tests of the above strains were carried out in respect to peni-
 cillin, streptomycin, tetracyclines, chloramphenicol, erythromycin and neomycin. It
 was found that resistance to antibiotics in Streptococci differed from that in Gram-
 negative bacilli. Streptococcus fecalis was found highly resistant to penicillin and
 erythromycin. Appreciable resistance to all antibiotics was noted in strains identified
 as Streptococcus viridans. Resistance varied according to samples and territorial dis-
 tribution. Experiments were conducted in 11 centers throughout the country simultane-
 ously; results were compared with those obtained in an identical experimental series in
 a single hospital environment. Orig. art. has: 2 tables. SPS
